

MALACHITE FL-25-SM

FreshWater's Malachite (FL-25-SM) filter cartridge has been specially formulated to remove fluoride from drinking water.

How does FreshWater's Malachite filter cartridge work?

Water passes into the filter housing and then through the Malachite's granular activated alumina filtration media. This removes fluoride.

Do I need to remove fluoride?

A small number of health trusts instruct water companies to fluoridate drinking water. We would suggest visiting the [NHS's page](#) about fluoride and fluoridation for the most up to date information, so that you can decide whether you wish to remove fluoride from your drinking water.

Similarly, you can visit your local water board's website to find out about their approach to fluoridation.

How is the Malachite filter cartridge fitted?

FreshWater's Malachite filter cartridge can be fitted as part of a FreshWater FW2000 system, which uses two filter cartridges.

How often does the Malachite filter cartridge need changing?

FreshWater's Malachite filter cartridge will remove fluoride from up to 2100 litres of water. However, as you might expect, fluoride concentration can vary from locality to locality.

Can I keep a spare Malachite filter cartridge?

Yes, you can – but please remember that like much filter media, the Malachite has a shelf life of 6 months. Please also remember that filter cartridges should always be stored sealed and in a cool environment.
